Dyna T for ALL LMX100's

Must be equipped with DVL500 high resolution DVL

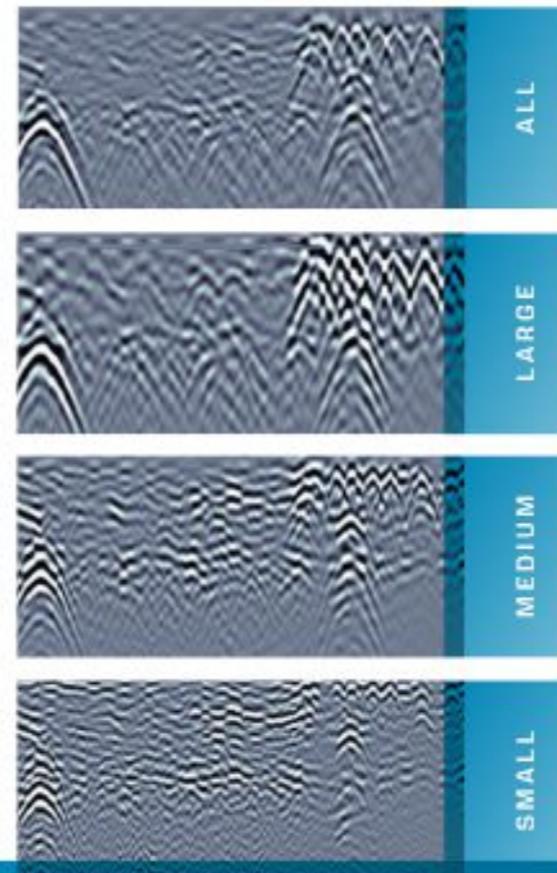

DynaT is perfect for users who want to see targets with multiple frequencies for enhancing size and depth.

DynaT is a feature that up until now was only available on the LMX200. And NOGGIN carts.

DynaT can selectively enhance small, medium or large size targets for easier viewing and detection. Pressing DynaT cycles between screens, **All, Small, Medium** and **Large**.

DynaT enhances part of the frequency spectrum of the ultra-wide band (UWB) signal to focus on desired features detected at these different ranges. Higher range detects shallow and small targets and lower range detects deeper and larger targets. Selecting Small screen from DynaT will show more similar hyperbolas and more detail, whereas Large screen selection will focus more on larger targets with better depth penetration. Selecting All will display a combination of shallow targets and deep targets and small, medium and large targets.
